Consumer Confidence Report

As required by the Environmental Protection Agency and
the Environment Department of the State of New Mexico

June 2007

Annual Report on Drinking Water Quality – 2006

Entranosa Water & Wastewater Association

June 29, 2007

We are pleased to provide you with our report on drinking water quality, also known as the “Consumer Confidence Report (CCR)”. We provide this report every year, pursuant to federal law, in an effort to keep you informed about the water and services we delivered during the previous year. This report indicates that we are achieving our goal - to provide you with a safe and reliable supply of drinking water.

Is the water safe?

In calendar year 2006, as in years past, your tap water met the primary standards set by the U.S. Environmental Protection Agency (EPA) and the drinking water quality standards of the State of New Mexico (NMED). This past year, we conducted routine and random bacteriological testing, and assisted the NMED in obtaining water samples to test for the contaminants covered by the Safe Drinking Water Act (SDWA). Although some of the tests reflected the presence of a contaminant, none of them were higher than the levels authorized by EPA. While we did not violate a maximum contaminant level in 2006, we did experience a violation in February of 2007 related to total coliform (we discuss that at the bottom of page 2). That issue has been resolved, and – yes – your water remains safe.

Do I need to take special precautions?

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as those with cancer (undergoing chemotherapy), persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Water Drinking Hotline (800-426-4791) ... although *Cryptosporidium* is not normally associated with groundwater sources.

Where Does The Water Come From?

In 2006, we obtained our water from seven wells, located in two separate well fields and we obtained equal amounts from each well field. Our historic source is the Horton Well Field, with water drawn from the fractured Madera Limestone formations of the Estancia Basin. Our other source is from two wells in the north central part of the Estancia Basin, with water drawn from the graveled alluvium and fractured sandstone formations. The wells pump water to storage tanks which, in turn, serve booster stations that lift it to storage tanks at higher elevations (we disinfect the water at the booster stations). From these storage tanks, the water flows by gravity to your home or to another booster station – such as in Magic Valley, portions of Sandia Mountain Ranch, Woodlands, Steeplechase, and Rancho Verde. We utilize an approved EPA disinfection technology called MIOX, which produces multiple, redundant, disinfection agents by means of an electro-chemical reaction using sodium chloride (table salt). Two of the disinfection agents are ozone and a weak chlorine concentration. The ozone provides an immediate bacteriological kill to the fifth decimal, and the chlorine solution provides long-term protection in the water mains, serving as an inhibitor to bacteriological growth. We check the residual strength of the chlorine in various parts of the system on a weekly basis, and we obtain bacteriological samples on a monthly basis - these are analyzed at certified labs and the results are reported to NMED.

Source Water Assessment and its availability

We have received a Source Water Assessment from NMED, which was funded by a grant from the EPA. It is available for your review at our office. Should you wish to obtain your own copy, please contact Valerio Lopez in the Drinking Water Bureau (DWB) of NMED at 222-9538 (in Albuquerque), or email him at valerio.lopez@state.nm.us. Provide your name, address, phone number, and email address (if applicable). The DWB may charge a nominal fee for paper copies. The report states that the Entranosa system “...*is well maintained and operated, and sources of drinking water are generally protected from potential sources of contamination based on well construction, hydrogeological settings, and system operation and management ... The susceptibility rank of the entire water system is Moderately High*”. It is common throughout the United States to find potential sources of contamination located in the vicinity of wellheads, but continued regulatory oversight, wellhead protection plans and other planning efforts serve as the primary methods to protect the source water and ensure high quality drinking water.

Why are there contaminants in my drinking water?

Drinking water, including bottled water, may reasonably be expected to contain small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's (EPA) Safe Drinking Water Hotline (800-426-4791). The sources of drinking water (both tap water and bottled water) across the Nation include rivers, lakes, streams, ponds, reservoirs, springs, and wells (all of our water is sourced from deep wells). As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and (and in some cases, radioactive material), and can pick up substances resulting from the presence of animals or from human activity. Contaminants are categorized as: **Microbial contaminants**, such as viruses and bacteria, and may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; **inorganic contaminants**, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; **pesticides and herbicides** may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses; **organic Chemical Contaminants**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems. **Radioactive contaminants** can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Maximum Contaminant Level Violations

In February of this year, two of our bacteriological samples came back positive for total coliform, which represents a violation of 40 CFR 141.63(a)(2) for exceeding the MCL for microbiological contamination. Pursuant to law, and best practice, we immediately pulled six samples in the area of the violations – and all of them came back negative. Our conclusion is that there was a sampling error which caused false positive readings – regardless, we were in violation of standards and issued a public notice in our billing at the end of February. We will report this again in next years CCR.

Water Quality Data Table (2007)

The table below lists all of the drinking contaminants we detected during the period of 2001 through 2006. The presence of contaminants in the water does not necessarily indicate that the water poses a health risk. The EPA and NMED require us to monitor for certain contaminants less frequently than once a year because the concentrations of these contaminants do not fluctuate, and we show low levels of the contaminant.

<u>Contaminants</u>	<u>MCLG</u> or <u>MRDLG</u>	<u>MCL,</u> <u>TT, or</u> <u>MRDL</u>	<u>Average</u> <u>Your</u> <u>Water</u>	<u>Range</u>		<u>Sample</u> <u>Date</u>	<u>Violation</u>	<u>Typical Source</u>
				<u>Low</u>	<u>High</u>			
Disinfectants & Disinfection By-Products								
(There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.)								
Chlorine (as Cl ₂) (ppm)	4	4	0.4	0.13	0.81	2006	No	Water additive used to control microbes
Haloacetic Acids (HAA5) (ppb)	NA	60	2.6	1.3	4.0	various	No	By-product of drinking water chlorination
TTHMs [Total Trihalomethanes] (ppb)	NA	80	4.0	2.2	5.7	various	No	By-product of drinking water disinfection
Inorganic Contaminants								
Arsenic (ppb)	0	50	2	1	3	2005	No	Erosion of natural deposits; Runoff from orchards; Runoff from glass and electronics production wastes
Barium (ppm)	2	2	0.2	0.1	0.2	2005	No	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits
Fluoride (ppm)	4	4	0.59	0.51	0.67	2005	No	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories
Nitrate & Nitrite [measured as Nitrogen] (ppm)	10	10	1.4	0.99	1.8	2005	No	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits
Microbiological Contaminants								
Total Coliform (positive samples/month)	0	0	0	NA		2006	No	Naturally present in the environment
Radioactive Contaminants								
Alpha emitters (pCi/L)	0	15	5.24	0.49	5.24	2005	No	Erosion of natural deposits
Radium (combined 226/228) (pCi/L)	0	5	1.26	0.55	1.26	2005	No	Erosion of natural deposits
Uranium (ug/L)	0	30	6.84	3	6.84	2005	No	Erosion of natural deposits

<u>Contaminants</u>	<u>MCLG</u>	<u>AL</u>	<u>90th Percentile</u>	<u>Sample Date</u>	<u># Samples over AL</u>	<u>Exceeds AL</u>	<u>Typical Source</u>
Inorganic Contaminants							
Copper - action level at consumer taps (ppm)	1.3	1.3	0.91	2006	1	None	Corrosion of household plumbing systems; Erosion of natural deposits
Lead - action level at consumer taps (ppb)	0	15	13	2006	0	None	Corrosion of household plumbing systems; Erosion of natural deposits

Unit Descriptions	
<u>Term</u>	<u>Definition</u>
ug/L	ug/L : Number of micrograms of substance in one liter of water
Ppm	ppm: parts per million, or milligrams per liter (mg/L)
Ppb	ppb: parts per billion, or micrograms per liter (µg/L)
pCi/L	pCi/L: picocuries per liter (a measure of radioactivity)
positive samples/month	positive samples/month: Number of samples taken monthly that were found to be positive
NA	NA: not applicable
ND	ND: Not detected
NR	NR: Monitoring not required, but recommended.

Important Drinking Water Definitions	
<u>Term</u>	<u>Definition</u>
MCLG	MCLG: Maximum Contaminant Level Goal: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
MCL	MCL: Maximum Contaminant Level: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
TT	TT: Treatment Technique: A required process intended to reduce the level of a contaminant in drinking water.
AL	AL: Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.
Variances and Exemptions	Variances and Exemptions: State or EPA permission not to meet an MCL or a treatment technique under certain conditions.
MRDLG	MRDLG: Maximum residual disinfection level goal. The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
MRDL	MRDL: Maximum residual disinfectant level. The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
MNR	MNR: Monitored Not Regulated
MPL	MPL: State Assigned Maximum Permissible Level

Radon

Radon is a radioactive gas that you can't see, taste, or smell. It is found throughout the U.S. Radon can move up through the ground and into a home through cracks and holes in the foundation. Radon can build up to high levels in all types of homes. Radon can also get into indoor air when released from tap water from showering, washing dishes, and other household activities. Radon entering your home through tap water, compared to radon entering the home through soil, is a very small percentage of

radon in indoor air. Radon is a known human carcinogen. Breathing air containing radon can lead to lung cancer. Drinking water containing radon may also cause increased risk of stomach cancer. Studies indicate that up to two percent of airborne Radon in the home is sourced from aeration of water. If you are concerned about radon in your home, you can test for it. The New Mexico Environment Department has a Radon Outreach Program and you may be able to obtain a free test kit by calling Michael Taylor at (505) 827-1093. Authorities recommend that you fix your home if the level of radon in your air is 4 picocuries per liter (pCi/L) of air or higher. There are simple ways to fix a radon problem that aren't too costly, which include ventilating the home. For additional information, call NMED at (505)827-1093 or call EPA's Radon Hotline (800-SOS-RADON).

Other Information

Most of the questions we receive about the quality of water do NOT deal with the main contents of this report nor the primary contaminants and health aspects of water, but with the secondary characteristics of the water - iron, calcium, hardness, etc. - the 'esthetics'. Our water sources (well fields) have different characteristics because they are derived from different geologic formations. The table that follows is intended to help answer the common queries, divided by source. Note that the 'mix' of the water will vary throughout the year, from month to month, due to maintenance, weather conditions, and demand.

Table of Other Information for Source Water

Characteristics	Horton Field	Pine Canyon
Iron	< 0.1 mg/L	< 0.1 mg/L
Manganese	< 0.05 mg/L	< 0.05 mg/L
Silica	9.14 mg/L	9.56 mg/L
Sodium	32.2 mg/L	15.8 mg/L
Sulfate	28.3 mg/L	33 mg/L
Hardness (Ca & Mg)	578 mg/L	197 mg/L
Calcium	173 mg/L	45.2 mg/L
Magnesium	34.6 mg/L	20.3 mg/L
Chloride	20.6 mg/L	< 10 mg/L

How can I get involved?

Entranosa is a cooperative association organized under the Cooperative Act with a mission to provide quality drinking water services to the community and the membership of the Association. Every member can participate in one way or another – to include simply asking questions and providing us information. Should you wish to actively participate with the Association, call John at the office (281-8700) or call and ask for one of the board members to contact you – there may be room on a committee, or a special project in which we could utilize your talents. You may choose to attend Board Meetings – normally held on a monthly basis on the third Thursday of each month – but we request you contact us prior to the meeting so we can make appropriate arrangements for seating, and to confirm the meeting date and time. The Board of Directors (Steve Varley, Steve Hicks, Ron Bodo, Carolyn Freeman, Paul Gorder, John Brault, and Steve Beffort) would welcome your participation. Our contact information is located

on the coversheet to this report, and it also appears on our billing statements. The next board meeting will be July 19th at 6:15 pm.

Annual Meeting

Our annual meeting will be held on October 2nd of this year. You'll receive a meeting packet in early September with an agenda, details of the meeting, and the financial results of our audit conducted this past April - but don't wait - please plan, **NOW**, to attend. You will be electing, or reelecting, three seats on the Board this year, and during the meeting we'll present information about the activities of the Association. If you are interested and have some time to commit, please consider running for the Board of Directors – nominations are due in the Entranosa office by close of business on August 7th. A nomination can consist of a note that says "I would like to run for the board of directors".

Drought and Conservation

While we are no longer in a severe drought condition – we DO live in the arid southwest and we are ALWAYS in one stage of drought or another. Our monthly newsletters typically contain drought information, and we've offered many suggestions on your water use – which always comes down to "Use what you need, not more." Our wells are generally deep, but we'll need to reequip a couple of them over the next several years (larger pumps), we may deepen one of them, and we'll install additional pumps in our booster stations – so we have, and will retain, the capacity to serve you. We have 'conservation' materials at the office and there are dozens of web sites that address conservation and household use. You might consider examining how to use grey water to get more out of the water you bring into your home – and consider the purchase of a rain barrel(s) and creating a water harvesting system off of your roof. In our planning process, we allocate 1/3 of an acre foot of water for each dwelling – about 108,000 gallons per year. If you restrict your usage and conserve water, it does not create 'more water' for us to use on development – our development policy requires that new services fund their connection to the system, which includes bringing funding for additional water rights. Having said that – while our conservation plan has, traditionally, been effective – the region needs a regional plan. Without conservation in agricultural use of water in the Estancia Basin – our efforts do not mean much. As a reminder – we use less than 2% of the water pumped from the Estancia Basin, which is the equivalent of four or five crop circles of corn – and we feed almost 2900 families with that resource.

Call Before You Dig – it IS the Law
